Name: Nikhil. P
Roll No: 170041

Question2: What happens when we decrease the support level? Why?

Answer: Support represents the popularity of that product of all the product transactions. Support of the product is calculated as the ratio of the number of transactions includes that product and the total number of transactions.

Support of the product = (Number of transactions includes that product)/ (Total number of transactions)

When we decrease the support level, we decrease the amount of popularity we need.
